

Full Copy Sandbox

Test and validate in a safe, isolated copy of your production

Full copy sandbox provides a production-equivalent environment that enables your teams to safely validate changes, test integrations, and train users without impacting your live instance.

By creating a complete replica of your production environment, including data, configurations, files, and system behavior, you can ensure that every change is validated before it goes live.

Why it matters

As production environments evolve with new features, integrations, configuration updates, and permissions, validating production behavior accurately before rollout can become increasingly difficult. Full copy sandbox ensures that testing will reflect exactly what your users will experience.

What you can achieve

Validate with accuracy

Test new features, workflows, and configurations using real data and real conditions so you catch issues before users do.

Ensure integration reliability

Safely validate integrations with systems such as HR platforms, CRM systems, and APIs before deployment so launches happen with confidence.

Train with real context

Prepare users in an environment that reflects your actual content, structure, and workflows so teams don't have to learn on live systems.

What makes this powerful

A true replica

Work with real data, real configurations, and real scale so what you test is what you get.

Isolation by design

All sandbox activity remains fully isolated. Notifications stay disabled and integrations are configured independently to protect production operations.

Enterprise-ready security and compliance

Data remains within the same geographic region as production, with access controls aligned to your live environment.

Predictable refresh model

Keep your sandbox aligned with production through controlled full refreshes every 30 days, without ongoing operational overhead.

Operational and security considerations

Sandbox setup and refresh timelines depend on environment size, with larger instances taking up to approximately 24 hours.

Each refresh fully replaces the sandbox with a new copy of production.

The sandbox operates independently from production, with integrations configured separately.

Outbound communications are disabled by default, and access controls are consistent with your live environment.

About Simplr

Simplr is the AI-powered intranet for unifying the digital workplace, bringing people, trusted knowledge, apps, and agents into a coherent digital experience. Powered by an EX knowledge graph, it delivers personalized communications, answers, and actions with enterprise-grade security, governance, and extensibility. Learn more at simplr.com.
